

Precise

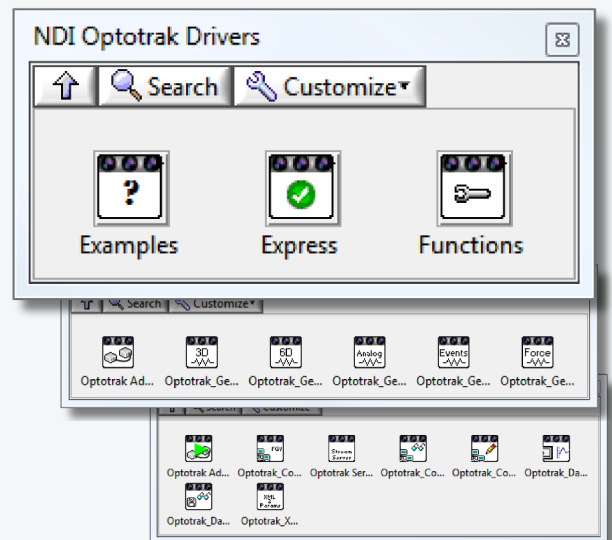

Accurate

Reliable

The Optotrak Certus measurement system tracks real-time movement with exceptional accuracy and resolution. It also uses an active marker system to prevent the camera from getting confused during the marker identification and localization process.

The drivers allow for real-time streaming of position and orientation from an Optotrak host computer directly to the LabVIEW environment on a secondary computer. This allows for offloading of valuable CPU resources on the secondary computer. The drivers can be configured easily in the Advanced Interface which comes as an out-of-the-box solution for data acquisition. The drivers also include a palette to allow you to get under the hood and access data directly in your custom LabVIEW applications.

**+** Hardware Accessories Also Available: simVITRO line of IP65 rated markers and repeatable placement marker mounts are ideal for harsh environments and repetitive testing
